*Abstract:* The Internet has been considered a new alternative for teaching-learning processes; vocational assessment; counseling and orientation (virtual psychological consultation); and intervention focused on specific health-related problems. The experiences of on-line psychological services and their conclusions constitute a valuable body of knowledge for the e-learners and interested users of the psychology science. However, such knowledge is widespread in the World Wide Web and consequently hardly accessed by the end-users. In this paper, an e-course platform is presented that serves the delivery of such knowledge via instructional-informative and communication web tools.
